

Environmental Sustainability

As part of our quality system, we try wherever possible to reduce our environmental impact. Our carbon footprint is being reduced by the policy of only buying company cars that now have a low carbon rating of 110g/km and are fuel efficient. The haulage companies we use must have vehicles not older than 2009 plates. Better planning of routes using new I.T to reduce traffic hold ups and unnecessary journeys.

We have taken initiatives to ensure environmentally friendly and sustainable products are used, for example for our timber products only companies with documented sustainable policy and the correct certification will be used. Alternative materials to sustainable timber are being sourced like recycled plastic products such as our plastic barriers & fencing, temporary roadway mats and speed/hose ramps.

All metal products when beyond use are taken to recycle scrap premises. Old oils, old shotblast shot, I.T products and plastics are all retained for recycling by outside partners.
